

Password Reset Guide

Standard self-service reset

1. Click 'Forgot password?' on the login screen.
2. Enter the email address associated with your account.
3. Check your inbox for a reset link, valid for 30 minutes.
4. Choose a new password of at least 10 characters, including one number and one symbol.
5. You will be logged out of all other active sessions automatically once the new password is confirmed, as a security precaution.

Reset email not arriving

If the reset email does not arrive within 5 minutes: check spam/junk folders; confirm the email address you entered exactly matches the one on file (typos are the most common cause); confirm with your IT team that corporate mail filtering is not blocking mail from no-reply@ourapp.com.

Reset link expired or already used

Reset links are single-use and expire after 30 minutes for security. If your link has expired, simply request a new one from the 'Forgot password?' screen — there is no waiting period between requests under normal circumstances.

Critical error code E401 during reset

Error code E401 during a password reset attempt indicates the account is currently flagged by our fraud detection system, usually triggered by repeated reset requests in a short window combined with a recent profile change (such as an email or billing update). When E401 appears:

- Self-service reset is temporarily disabled for the account for up to 24 hours as a precaution.
- The account owner receives a manual verification email from our security team rather than an automatic reset link.
- This cannot be bypassed by automated support — it requires a human agent to verify identity and clear the flag manually.

Password requirements

Minimum 10 characters, at least one number, one symbol, and one uppercase letter. Passwords cannot match any of your last 5 previous passwords. We check new passwords against a known-breached-credential list and will reject matches even if all complexity rules are met.
